No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage agent, after lysis of recombinant host cells. The constructs containing the purified HCV envelope proteins can be use for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or more serological types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporate into a reversed phase hybridisation assay for determining the presence the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1 E2 and E1/E2, and eliminates contaminating proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               produce

                                                                                                                                                                                    and E2 protein coding sequence constructs. These sequences are included In vectors for the production of recombinant E1, E2, and E1/E2 proteins. In the method, the be isolated using a method of the invention. In the method, the envelope proteins are purified by CC carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a CC The constructs containing the purified HCV envelope proteins can be used CC for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or CC constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or CC the genotype of HCV. The new purification method preserves the CC conformation of the recombinantly expressed E1, E2 and E1/E2, and E1/E2, and E1/E2, and E1/E2.

In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage agent, after lysis of recombinant host cells. The constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or more serological types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed El, E2 and EL/E2, and eliminates contaminating proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAT12704-T12709 and AAT12961-T12974 represent hepatitis C virus (HCV) and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 protein the recombinant proteins can then be isolated using a method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 795

In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, after lysis of recombinant host cells. The constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV. for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or more serological types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence of the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed in E2 and E1/E2, and
                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins. The recombinant proteins can then be isolated using a method of the invention. In the method, the envelone proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Purifying recombinant hepatitis C virus (HCV) El and proteins - in presence of disulphide bond cleavage produce proteins suitable for direct use in vaccines assays of HCV
                                                                                                                                                                                                                                                                                                                                       eliminates contaminating proteins. Antigens isolated are more reactive with human sera than those isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAT12704-T12709 and AAT12961-T12974 represent hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 23; Fig 21; 146pp; English.

The constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or more serological types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and eliminates contaminating proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known

Gowans EJ, MacNaughton TB;

1998-377411/32 AAW62825

Virus-like particle for, e.g. treating microbial infection comprises polypeptide from microorganism and sequence from Hepatitis D virus large protein, partially enveloped by Hepatitis B surface antigen

Example; Fig 4. 72pp; English

This nucleotide comprises the hepatitis C virus (HCV) cDNA insert in plasmid pA10. This cDNA was obtained by PCR amplification of HCV cDNA using primers (see AAV38849-50) designed to amplify the HCV cDNA using primers (see AAV38849-50) designed to amplify the CTPA core gene. The PCR product was cloned into pBluescript KS to create pA10. It encodes a 224-amino acid polypeptide (see AAW62825). The HCV core protein can be used as an immunogen in novel fusion proteins (see AAW62657-59) that comprise HCV core protein and at least 19 amino acids (see AAW62827) of the C-terminal sequence of the large protein from hepatitis D virus (L-HDAg). In novel virus-like particles of the invention, a fusion protein immunogen is at least partially enveloped by hepatitis B surface antigen. The virus-like particle is used to ameliorate or protect against infections caused by hepatitis B virus and/or another microorganism, especially HCV. Sequence BP; 115

The polypeptide it encodes may be used in a system for detecting NANB hepatitis. This method is highly specific and sensitive, and can detect NANB hepatitis virus which could not be detected by conventional methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Antigen related to non-A and non-B hepatitis virus non-translation region comprising 340 - 341 mols. of non-translation region comprising 1885 - 2551 mols. nucleotides including region 1,149 and, etc.

These fragments were amplified using the primers given in AAQ63732-51. These primers were used in the detection of NANBH. The primers are based on the 5'-terminal region and the core protein coding region. The method allows highly sensitive detection of NANBHV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonucleotide primer virus - used for high s hepatitis virus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Qy
The invention relates to Hepatitis C virus (HCV) variants which include CC polynucleotides comprising non-naturally occurring HCV sequence and HCV CC variants that have a transfection efficiency and ability to survive Subpassage greater than HCV that have wild-type polyprotein coding CC regions. The polynucleotides of the invention are useful for identifying CC acell line that is permissive for infection with HCV and detecting CC replication of HCV in cells of the cell line. They are also useful for CC testing a compound for anti-viral properties and for inhibiting HCV CC infection. They are also useful for the generation of defined HCV virus CC stocks to develop in vitro and in vivo assays for virus neutralisation, CC attachment, penetration and entry, structure/function studies on HCV CC proteins and RNA elements and identification of new antiviral targets, CC a systematic survey of cell culture systems and conditions to identify CC chose that support wild-type and variant HCV RNA replication and CC particle release, production of adaptive HCV variants capable of more celficiency replication in cell culture, production of alternative animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁

                                                                8
                                                                                                                                                                     CC polyniclectides comprising non-naturally occurring HCV sequence and HCV covariants that have a transfection efficiency and ability to survive convariants that have a transfection efficiency and ability to survive convariants that have a transfection efficiency and ability to survive convariants that have a transfection are useful for identifying converges. The polynucleotides of the invention are useful for identifying care acell line that is permissive for infection with HCV and detecting converges are also useful for the generation are also useful for testing a compound for anti-viral properties and for inhibiting HCV confection. They are also useful for the generation of defined HCV virus for the generation of defined HCV virus stocks to develop in vitro and in vivo assays for virus neutralisation, converges and the entities of the survey of cell culture systems and conditions to identify those that surport wild-type and variant HCV RNA replication and converges that support wild-type and variant HCV RNA replication and converges that support wild-type and variant HCV variants capable of more efficiency replication in cell culture, production of HCV variants with altered tissue or species tropism, establishment of alternative animal conditions of immunogenic HCV particles for vegolication assays, and conditions of immunogenic HCV particles for vegolication assays. Conditions of immunogenic HCV particles for vegolication assays, and for utilisation of the HCV plycoproteins for targetted delivery of thereapy and vaccine applications of attenuated or defective HCV particles for vaccine applications of immunogenic HCV particles for vaccine applications of immunogenic HCV in a primate. The present sequence is useful for inducing that results in Ser to lie at position 1179 of HCV replibartMan protein, where the 5'NTR is fused to the neomycin phosphotransferase gene and conditions of the EMCV IRBS is inserted upstream of the HCV open reading frame.

(I) contains the HCV-specific RNA segments 5'-NTR (non-translated region), NS (non-structural)3, NS4A, NS4A, NS5A, NS5B and 3'-NTR, and a selectable (marker) gene (II). The cell cultures, and/or (I), are used to prepare, evaluate and/or test therapeutic and/or diagnostic agents for HCV infections, and to prepare vaccines against HCV infection (particularly preparation of attenuated HCV). The can also be used for preparation of a liver-specific delivery system for gene therapy, and to identify cells permissive for HCV in this cellular system, so that variations in replication rates can be measured (for screening antiviral agents) quantitatively or qualitatively, using standard laboratory equipment. Efficient replication of HCV RNA is only achieved when the specified RNA segments are present and when the transfected cells are maintained under permanent selection pressure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

This sequence was derived by amplification by polymerase chain reaction. The nucleotide sequences derived from this amplification can be used to detect NANBHV infection which contropy the detected by conventional methods. The detection kits allow highly specific and sensitive detection at an early phase of infection. The polypeptide product of this coding sequence can be for the manufacture of vaccines and immunological pharmaceuticals and also to produce antibodies specific to NANBHV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant cDNA of NANBH virus strain peptides - useful for diagnosis and in

                 The sequence is that of a DNA fragment encoding a non-A non-B (NANB) hepatitis-specific antigen polypeptide, it can be used to produce the polypeptide recombinantly. It is derived from the DNA clone C10-E12. It can be used to give PCR primers which are capable of detecting NANE hepatitis with high accuracy. See also AAQ20617-Q20629 and AAQ20922-Q20926.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the 5' region of hepatitis C virus RNA. The original sample was obtained from human and chimpanzee plasma. RNA was isolated from several samples and homology compared, and the respective sequence of about 1900 - 2500 nucleotides of the 5' terminus and 1000 nucleotides of the 3' terminus determined. The 5' region (given) contains a non-coding region of at least 340 nucleotides and a region coding for the structural protein followed by a region coding for the non-structural protein (none actually detailed on the sequence given in the specification). When compared with the sequence of HCV disclosed in EP-388232 this sequence showed homology of 80.5%.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detection of non-A, non-B hepatitis virus - using new oligo-nucleotide primers with nucleotide sequences corresp. part. of the viral RNA

//Ote-stayer vector: Lambda Uni_ZAP XR, excised phagemid;
Site_1: EcoRI; Site_2: XhoI; Plants were grown under
hydroponic conditions at UC Davis, salt stressed for 12
hours, and for 7 days, then dissected and frozen (Akhunov
in J Dvorak Lab). Total RNA was prepared from sheath
tissue, equal quantities of RNA were pooled from the two
samples, polyA was purified from the pooled RNA, a CDNA
library was made, and the CDNA clones were in vivo
excised to give paluescript phagemids in the TJ Close lab
at the University of California, Riverside (Akhunov, Chin,
Choi, Close, Fenton, Kianian, Otto, Simons, Zhang).
Plasmid DNA preparations and DNA sequencing were
performed in the OD Anderson lab (all other authors)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          In J Dvorak Lab). Total RNA was prepared from sheath tissue, equal quantities of RNA were pooled from the two samples, polyA was purified from the pooled RNA, a CDNA library was made, and the CDNA clones were in vivo excised to give pBluescript phagemids in the TJ Close lab at the University of California, Riverside (Akhunov, Chin, Chos, Fenton, Kianian, Otto, Simons, Zhang). Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."
